

# USAF Virtual Desktop Solution

intlix Solutions designed and implemented a virtual desktop infrastructure (VDI) solution using Nutanix and VMware for the United States Air Force.

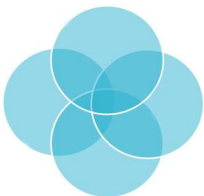

The USAF requires users to remove the hard drives in their existing computers each night and then re-install them before the start of each day, slowing productivity.

USAF hard drives that are not used for extended periods of time would be out of specification with current updates. User's workstations would be quarantined requiring an onsite visit from IT personnel to update that workstation. The USAF needed to:

- Free IT staff from having to manage local desktop assets
- No longer budget for workstations that may never actually be used
- Update to Windows 10 operating system without hardware concerns
- Add more users without a large upgrade investment

intlix Solutions captured the current build that was in use for physical desktops and assisted the USAF in optimizing a baseline image for use in a virtual desktop environment, providing training for the IT staff to support the VMware software and Nutanix platform.

intlix Solutions is a company founded by engineers who work with the leading and emerging hyper-converged vendors to design, implement and provide ongoing support.
